Operation Manual

PV100 Series
Solar Pumping Inverter

FOSHAN SUOER ELECTRONIC INDUSTRY CO., LTD

Contents

1 Safety precautions

Please read this manual carefully and follow all safety precautions before moving, installing, operating and servicing the inverter. If ignored, physical injury or death may occur, or damage may occur to the devices.

If any physical injury or death or damage to the devices occurs for ignoring to the safety precautions in the manual, our company will not be responsible for any damages and we are not legally bound in any manner.

1.1 Safety definition

Danger:	Serious physical injury or even death may occur if not follow relevant requirements
Warning:	Physical injury or damage to the devices may occur if not follow relevant requirements
Note:	Physical hurt may occur if not follow relevant requirements
Qualified electricians:	People working on the device should take part in professional electrical and safety training, receive the certification and be familiar with all steps and requirements of installing, commissioning, operating and maintaining the device to avoid any emergency.

1.2 Warning symbols

Warnings caution you about conditions which can result in serious injury or death and/or damage to the equipment, and advice on how to avoid the danger. Following warning symbols are used in this manual:

Symbols	Name	Instruction	Abbreviation
 Danger	Danger	Serious physical injury or even death may occur if not follow the relative requirements	
 Warning	Warning	Physical injury or damage to the devices may occur if not follow the relative requirements	
 Do not	Electrostatic discharge	Damage to the PCBA board may occur if not follow the relative requirements	
 Hot sides	Hot sides	Sides of the device may become hot. Do not touch.	
Note	Note	Physical hurt may occur if not follow the relative requirements	Note

1.3 Safety guidelines

☐Only qualified electricians are allowed to operate on the inverter.

☐Do not carry out any wiring and inspection or changing components when the power supply is applied. Ensure all input power supply is disconnected before wiring and checking and always wait for at least the time designated on the inverter or until the DC bus voltage is less than 36V. Below is the table of the waiting time:

Inverter model		Minimum waiting time
1PH 220V	0.4kW-2.2kW	5 minutes
3PH 220V	4kW-7.5kW	5 minutes
3PH 380V	0.75kW-37kW	5 minutes

☐ Do not refit the inverter unauthorized; otherwise fire, electric shock or other injury may occur.

☐ The base of the radiator may become hot during running. Do not touch to avoid hurt.

☐ The electrical parts and components inside the inverter are electrostatic. Take measurements to avoid electrostatic discharge during relevant operation.

1.3.1 Delivery and installation

☐ Please install the inverter on fire-retardant material and keep the inverter away from combustible materials.

☐ Do not operate on the inverter if there is any damage or components loss to the inverter.

☐ Do not touch the inverter with wet items or body, otherwise electric shock may occur.

Note:

☐ Select appropriate moving and installing tools to ensure a safe and normal running of the inverter and avoid physical injury or death. For physical safety, the erector should take some mechanical protective measurements, such as wearing safety shoes and working uniforms.

☐ Do not carry the inverter by its cover. The cover may fall off.

☐ Ensure to avoid physical shock or vibration during delivery and installation.

☐ Install away from children and other public places.

☐ The inverter cannot meet the requirements of low voltage protection in IEC61800-5-1 if the altitude of installation site is above 2000m.

☐ The leakage current of the inverter may be above 3.5mA during operation. Ground with proper techniques and ensure the grounding resistor is less than 10 . The conductivity of PE grounding conductor is the same as that of the phase conductor (with the same cross sectional area).

□ (+) and (-) are DC power supply input terminals. R, S and T (L,N) are AC power supply input terminals. U, V and W are output terminals. Please connect the input power cables and motor cables with proper techniques; otherwise the damage to the inverter may occur.

1.3.2 Commission ing and running

	□ Disconnect all power supplies applied to the inverter before the terminal wiring and wait for at least the designated time after disconnecting the power supply. □ High voltage is present inside the inverter during running. Do not carry out any operation except for the keypad setting. □ The inverter cannot be used as "Emergency-stop device". If the inverter is used to break the motor suddenly, a mechanical braking device should be provided.

Note:

□ Do not switch on or off the input power supply of the inverter frequently.

□ For inverters that have been stored for a long time, check and fix the capacitance and try to run it again before utilization.

□ Cover the front board before running, otherwise elect ric shock may occur.

1.3.3 Maintenanc e and replacement of components

	□ Only qualified electricians are allowed to perform the maintenance, inspection, and components replacement of the inverter. □ Disconnect all power supplies to the inverter before the terminal wiring. Wait for at least the time designated on the inverter after disconnection. □ Take measures to avoid screws, cables and other conductive materials to fall into the inverter during maintenance and component replacement.

Note:

□ Please select proper torque to tigh ten screws.

□ Keep the inverter, parts and components away from combustible materials during maintenance and component replacement.

□ Do not carry out any isolation voltage-endurance test on the inverter and do not measure the control circuit of the inverter by megameter.

1.3.4 Scrap treatment

	□ There are heavy metals in the inverter. Deal with it as industrial effluent.
	□ When the life cycle ends, the product should enter the recycling system. Dispose of it separately at an appropriate collection point instead of placing it in the normal waste stream.

2 Product overview

2.1 Unpacking inspection

Check as follows after receiving products:

1. Check that there are no damage and humidification to the package.
2. Check the information on the type designation label on the outside of the package to verify that the drive is of the correct typ .
3. Check that there are no signs of water in the package and no signs of damage or breach to the inverter.
4. Check the information on the type designation label on the outside of the package to verify that the name plate is of the correct type.
5. Check to ensure the accessories (including user's manual and control keypad) inside the device is complete.

2.2 Name plate

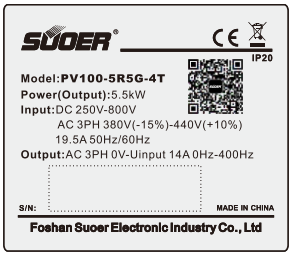

Figure 2-1 Name plate

Note: This is the example of PV100 standard products and the CE\TUV\Ip20 certifications are marked according to the reality.

2.3 Type designation key

The type designation contains information on the inverter. The user can find the type designation on the type designation label attached to the inverter or the simple name plate.

PV 100 -5R5G -4 T -2

3 Installation guidelines

The chapter describes the mechanical installation and electric installation.

- Only qualified electricians are allowed to carry out what described in this chapter. Please operate as the instructions in Safety precautions. Ignoring these may cause physical injury or death or damage to the devices.
- Ensure the power supply of the inverter is disconnected during the operation. Wait for at least the time designated after the disconnection if the power supply is applied.
- The installation and design of the inverter should be complied with the requirement of the local laws and regulations in the installation site. If the installation infringes the requirement, our company will exempt from any responsibility. Additionally, if users do not comply with the suggestion, some damage beyond the assured maintenance range may occur.

3.1 Mechanical installation

3.1.1 Installation environment

The installation environment is the safeguard for a full performance and long-term stable functions of the inverter. Check the installation environment as follows:

Environment	Conditions
Installation site	Indoor
Environment temperature	The ambient temperature of inverter is -10℃~50℃ while air temperature change should be less than 0.5℃ per minute. The inverter will be derated once ambient temperature exceeds 40℃. It is not recommended to use the inverter if ambient temperature is above 50℃. To ensure reliability, do not use the inverter if the ambient temperature changes frequently. Provide cooling fan or air conditioner to control the internal ambient temperature below the required one if the inverter is used in a close space such as in the control cabinet. When the temperature is too low, if the inverter needs to restart to run after a long stop, it is necessary to provide an external heating device to increase the internal temperature, otherwise damage to the devices may occur.
Humidity	RH≤90%.No condensation is allowed.
Storage temperature	-40℃~+70℃. The temperature change rate is less than 1℃/minute.

Environment	Conditions
Running environment condition	The installation site of the inverter should: Keep away from the electromagnetic radiation source; Keep away from contaminative air, such as corrosive gas, oil mist and flammable gas; Ensure foreign objects, such as metal power, dust, oil, water cannot enter into the inverter(do not install the inverter on the flammable materials such as wood); Keep away from direct sunlight, oil mist, steam and vibration environment.
Pollution	Pollution degree 2
Altitude	Below 1000m If the altitude is above 1000m, please derate 1% for every additional 100m.
Vibration	≤ 5.8m/s^2(0.6g)
Installation direction	The inverter should be installed on an upright position to ensure sufficient cooling effect.

Note:

- PV100 series inverters should be installed in a clean and ventilated environment according to enclosure classification.
- Cooling air must be clean, free from corrosive materials and electrically conductive dust.

3.1.2 Installation direction

The inverter may be installed on the wall or in a cabinet.

The inverter needs be installed in the vertical position. Check the installation site according to the requirements below. See Appendix C Dimension drawings for frame details.

3.1.3 Installation manner

Figure 3-1 Installation manners

(2) The inverters support wall mounting and flange mounting.

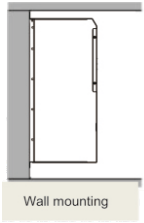

Figure 3.2 installation manners

1) Mark the locations of installation holes. For details about the holes, see the inverter dimension diagram in the appendix.

2) Fix the screws

3) Lean the inverter against the wall.

4) Fasten the tightening screws on the wall.

Note: The minimum space of A and B is 100mm. H is 36.6mm and W is 35.0mm.

3.2 Standard wiring

3.2.1 Terminals of main circuit

The figure below shows the standard wiring of inverter.

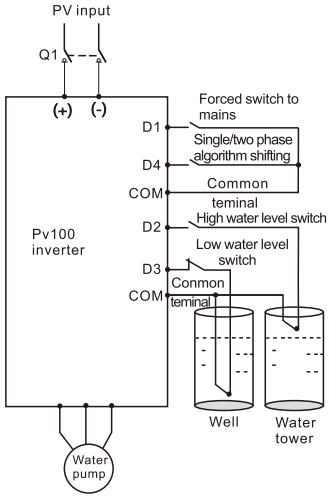

Figure 3-3 Standard wiring diagram

⚠	☐ The DC breaker Q1 must be installed as the protection switch for PV input. ☐ In parallel connection, the combination box special for PV must be used. ☐ When the distance between the PV input component and inverter exceeds 10 meters, type-II surge protection devices must be configured at the DC side. ☐ When the distance between the pump and inverter exceeds 50 meters, it is recommended to configure output reactors. ☐ The inverter automatically runs after being powered on. If parameters need to be set, follow the parameter setting instructions in chapter 5.

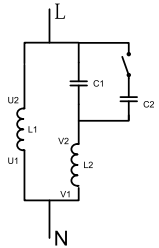
Terminals of main circuit

Terminal	Name	Function
R, S, T (L, N)	AC input	3PH (1PH) AC input terminals, connected to the grid
(+), (-)	PV input	Solar cell panel input terminals
U, V, W	Inverter output	3PH/1PH AC output terminals, connected to the pump motor Note: 1PH motors must connect to terminals U and W.
⏚	Safety grounding	Safety protection grounding terminal. Each inverter must be grounded

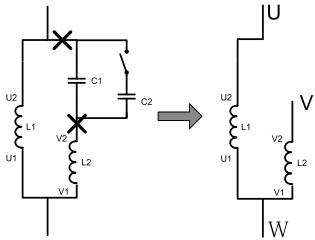
Description for -SS single-phase output models

1) Generally, the output terminals U and W of the inverter connect to the phase cables of the single-phase motor.

2) If the single-phase pump cannot be started, the two-phase control method must be used, and the start-up and running capacitors (if any) of the motor must be removed. The figure below shows the internal wiring of the common single-phase motor. In the figure, L1, L2, C1, and C2 indicate the running winding, start-up winding, running capacitor, and start-up capacitor. When the motor speed exceeds 75% of the rated speed, the start-up capacitor is switched off.



Internal wiring of the single-phase motor winding after removing the starting and running capacitor:



U1 and V1 are the common terminals of the windings. Connect them to the output terminal W of the solar pumping inverter. Connect U2 to the output terminal U of the inverter. Connect V2 to the output terminal V of the inverter. (Note: Use the screws equipped with the inverter.) Connect S4 of the inverter to COM in short circuited manner.

3.2.2 Terminals of control circuit

Functions of control terminals

Category	Terminal symbol	Terminal name	Terminal function
Power supply	24V	24V power supply	It provides the power of 24V±10% and maximum current of 200mA. It functions as the working power supply of digital input and output or externally connects to the sensor power supply.
	COM	Common terminal	
Digital input	D1	Forced switch to power frequency	Terminal feature parameters: 1. Internal impedance: 3.3kΩ 2. Acceptable voltage input: 12~24V 3. Maximum input frequency: 1kHz S1: Forcible switch to power frequency (Switching-on indicates switching to power frequency, and switching-off indicates input
	D2	Full-water alarm	
	D3	Empty-water alarm	
	D4	Single/two phase algorithm	

Category	Terminal symbol	Terminal name	Terminal function
		switching	controlled by the keypad.) S2: It connects to the high-water switch of the normally open contact by default. S3: It connects to the low-water switch of the normally closed contact. S4: A high electrical level corresponds to the single-phase algorithm. A low electrical level corresponds to the two-phase algorithm.
Communication	RS485+ RS485-	485 communication	485 communication terminals, using the ModBus protocol
	422TX+ 422TX- 422RX+ 422RX-	422 communication	Communication terminals special for the boost module.
Relay output	RO1A (ROA)	Normally open contact of relay 1	1. Contact capacity: 3A/AC250V, 1A/DC30V 2. They cannot be used for high frequency switch output. During the application of auto power frequency & PV switching, the AC input contactor coil is controlled by the normally closed contact of the relay.
	RO1B (ROB)	Normally closed contact of relay 1	
	RO1C (ROC)	Common terminal of relay 1	

4 Keypad operation procedure

4.1 Keypad introduction

Keypads are used to control PV100 series inverters, read the state data and adjust parameters. If external keypads are needed, select keypad extension wires.

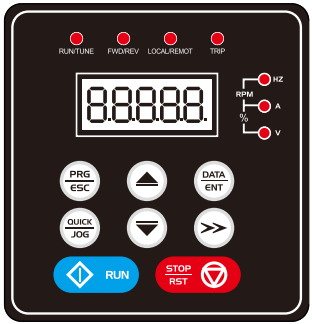


Figure 4-1 Keypad diagram for inverters

Serial No.	Name	Description	
1	State LED	RUN/TUNE	LED off means that the inverter is in the stopping state; LED blinking means the inverter is in the parameter autotune state;

</table>

4.2 Keypad displaying

The keypad displaying state of PV100 series inverters is divided into stopping state parameter, running state parameter, function code parameter editing state and fault alarm state and so on.

4.2.1 Displayed state of stopping parameters

When the inverter is in the stopping state, the keypad will display stopping parameters as shown in figure 4-1.

In the stopping state, various kinds of parameters can be displayed. Select the parameters to be displayed or not by F07.07. See the instructions of F07.07 for the detailed definition of each bit.

In the stopping state, there are 4 parameters that can be displayed. They are: set frequency, bus voltage, input terminals state, and output terminals state.

》/SHIFT can shift the parameters from left to right. QUICK/JOG(F07.02=2) can shift the parameters from right to left.

4.2.2 Displayed state of running parameters

After the inverter receives valid running commands, the inverter will enter into the running state and the keypad will display the running parameters. RUN/TUNE LED on the keypad is on, while the FWD/REV is determined by the current running direction which is as shown in figure 4-2.

In the running state, there are 6 parameters that can be displayed. They are: running frequency, set frequency, bus voltage, output voltage, output current, and rotating speed. 》/SHIFT can shift the parameters from left to right. QUICK/JOG(F07.02=2) can shift the parameters from right to left.

4.2.3 Displayed state of fault s

If the inverter detects the fault signal, it will enter into the fault pre-alarm displaying state. The keypad will display the fault code by flicking. The TRIP LED on the keypad is on, and the fault reset can be operated by the STOP/RST on the keypad, control terminals or communication commands.

4.2.4 Displayed state of function codes editing

In the state of stopping, running or fault, press PRG/ESC to enter into the editing state (if there is a password, see P07.00). The editing state is displayed on two classes of menu, and the order is: function code group/function code number → function code parameter, press DATA/ENT into the displayed state of function parameter. On this state, press DATA/ENT to save the parameters or press PRG/ESC to escape.

Figure 4-2 Displayed state

4.3 Keypad operation

Operate the inverter via operation panel. See the detailed structure description of function codes in the brief diagram of function codes.

4.3.1 How to modify the function codes of the inverter

The inverter has three levels menu, which are:

1. Group number of function code (first-level menu)
2. Tab of function code (second-level menu)
3. Set value of function code (third-level menu)

Remarks: Press both the PRG/ESC and the DATA/ENT can return to the second-level menu from the third-level menu. The difference is: pressing DATA/ENT will save the set parameters into the control panel, and then return to the second-level menu with shifting to the next function code automatically; while pressing PRG/ESC will directly return to the second-level menu without saving the parameters, and keep staying at the current function code.

Under the third-level menu, if the parameter has no flickering bit, it means the function code cannot be modified. The possible reasons could be:

1) This function code is not modifiable parameter, such as actual detected parameter, operation records and so on;

2) This function code is not modifiable in running state, but modifiable in stop state.

Example: Set function code F00.01 from 0 to 1.

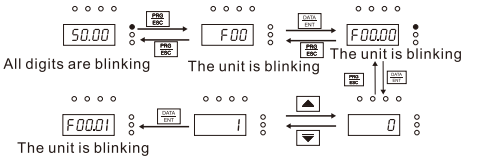

Figure 4-3 Sketch map of modifying parameters

4.3.2 How to set the password of the inverter

PV100series inverters provide password protection function to users. Set F07.00 to gain the password and the password protection becomes valid instantly after quitting from the function code editing state. Press PRG/ESC again to the function code editing state,

“0.0.0.0.0”will be displayed. Unless using the correct password, the operators cannot enter it. Set F07. 00to 0 to cancel password protection function.

The password protection becomes effective instantly after retreating from the function code editing state. Press PRG/ESC again to the function code editing state, “0.0.0.0.0” will be displayed. Unless using the correct password, the operators cannot enter it.

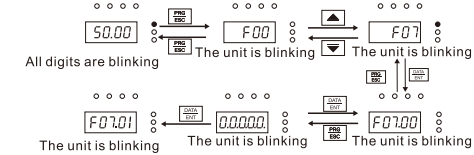

Figure 4-4 Sketch map of password setting

4.3.3 How to watch the inverter state through function codes

Pv100 series inverters provide group P17 as the state inspection group. Users can enter into P17 directly to watch the state.

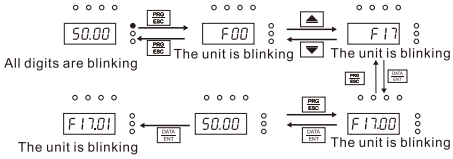

Figure 4-5 Sketch map of state watching

5 Commissioning guide lines

- Disconnect all power supplies applied to the inverter before the terminal wiring and wait for at least the designated time after disconnecting the power supply.
- High voltage is present inside the inverter during running. Do not carry out any operation except for the keypad setting.
- The inverter automatically runs once power on. If parameters need to be set, follow the guidelines in this chapter.

5.1 Inspection before operation

Before powering on the inverter, ensure that:

a) The inverter is grounded reliably.

b) The wiring is correct and reliable.

c) The AC/DC breaker is selected correctly.

d) The PV input voltage is in the allowed range of the inverter.

e) The type, voltage, and power of the motor match those of the inverter.

5.2 Trial r un

Close the DC breaker. The inverter automatically runs with a delay of 10 seconds. Check the water yield of the pump. If the water yield is normal, the trial run is successful. If the water yield is under the normal value, exchange any two motor cables, connect the cables, and perform trial run again.

5.3 Parameter settings

The inverter automatically runs by default once being powered on. If you want to set parameters, press QUICK/JOG within 10 seconds since the inverter power-on to switch to the keypad control mode (LOCAL/REMOT is off) and then set parameters. If the running indicator is already on after the inverter is powered on, press STOP/RST to enter the parameter setting mode. After parameter setting, turn off and then turn on the power switch. The inverter runs again.

5.4 Advanced settings

Note: The default settings of the inverter for the water pump can apply to most conditions and the advanced settings are not required in most cases.

5.4. PI adjustment to the water yield

If the user requires large or low water yield, it is necessary to adjust PI (F15.06~F15.10)

properly. The bigger PI parameters, the stronger the effect is, but the frequency fluctuation of the motor is bigger. In reserve, the lower the water yield is, the more stable the motor frequency is.

5.4.2 Special settings for single phase motors

a) When the single phase motor is in bad running performance, the user can adjust P04 VF curve settings: set F04.00=1 and set F04.03~F04.08 to appropriate values according to commissioning conditions; increase the voltage if the motor cannot start and decrease the voltage if the current is high.

b) When the light is normal and the system starts slowly, increase F15.28 initial voltage differential value appropriately.

c) For single phase motors with two-phase control (capacitor-removing):

① The maximum voltage needs to be less than 1/1.6 of the bus voltage. It is recommended to set the rated voltage F02.04 less than 200V, or limit the maximum voltage output by multi-dot V/F curve.

② Observe the currents of the windings through F17.38 and F17.39, the switched current is the combination current of the two windings. The impedances of the windings are different, so the currents are different at the same voltage output.

③ F04.35 can be used to change the output currents of the main and secondary windings. It is recommended that qualified engineers perform adjustment since the voltage adjustment is associated with motor design parameters. Otherwise, the motor performance may be impacted.

6 Function parameters

"○" : means the set value of the parameter can be modified on stop and running state;

"◎" : means the set value of the parameter cannot be modified on the running state;

"●" : means the value of the parameter is the real detection value which cannot be modified;

Note: The inverter implements auto checking and restriction on the parameter modification property. This prevents users from modifying parameters by misoperation.

6.1 Common function parameters for solar pumping inverter control

Function code	Name	Detailed illustration of parameters	Default	Modify
F00 Group	Basic function group			
F00.00	Speed control mode	0: SVC 0 applications which need small power. 1: SVC 1 2: SVPWM control Note: In vector control, the inverter must autotune motor parameters first.	2	◎
F00.01	Run command channel	Select the run command channel of the inverter. The control command of the inverter includes: start, stop, forward/reverse	1	○

Function code	Name	Detailed illustration of parameters	Default	Modify
		rotating, jogging and fault reset. 0: Keypad running command channel(“LOCAL/REMOT” light off) Carry out the command control by RUN, STOP/RST on the keypad. Set the multi-function key QUICK/JOG to FWD/REV shifting function (P07.02=3) to change the running direction; press RUN and STOP/RST simultaneously in running state to make the inverter coast to stop. 1: Terminal running command channel (“LOCAL/REMOT” flickering) Carry out the running command control by the forward rotation, reverse rotation and forward jogging and reverse jogging of the multi-function terminals. 2: Communication running command channel(“LOCAL/REMOT” on); The running command is controlled by the upper monitor via communication.		
F00.03	Max. output frequency	Setting range: F00.04~400.00Hz	50.00Hz	◎
F00.04	Upper limit of the running frequency	The upper limit of the running frequency is	50.00Hz	◎

Function code	Name	Detailed illustration of parameters	Default	Modify
		Setting range: F00.05~F00.03 (Max. output frequency)		
F00.05	Lower limit of the running frequency	Note: Max.output frequency ⩾ Upper limit frequency ⩾ Lower limit frequency Setting range: 0.00Hz~F00.04 (Upper limit of the running frequency)	0.00Hz	◎
F00.11	ACC time 1	ACC time means the time needed if the inverter speeds up from 0Hz to the Max. output frequency (F00.03). DEC time means the time needed if the inverter speeds down from the Max. Output frequency to 0Hz (F00.03). PV100 series inverters have four groups of ACC/DEC time which can be selected by F05. The factory default ACC/DEC time of the inverter is the first group. Setting range of F00.11 and F00.12: 0.0~3600.0s	Depend on mode	○
F00.12	DEC time 1		Depend on mode	○
F00.13	Running direction selection	0: Runs at the default direction. The	0	○

Function code	Name	Detailed illustration of parameters	Default	Modify
		inverter runs in the forward direction. FWD/REV indicator is off. 1: Runs at the opposite direction. The inverter runs in the reverse direction. FWD/REV indicator is on. Modify the function code to shift the rotation direction of the motor. This effect equals to the shifting the rotation direction by adjusting either two of the motor lines (U, V and W). The motor rotation direction can be changed by QUICK/JOG on the keypad. Refer to parameter F07.02. Note: When the function parameter comes back to the default value, the motor's running direction will come back to the factory default state, too. In pump application scenarios, the inverter cannot run in the reverse direction. This function code cannot be modified. 2: Forbid to run in reverse direction: It can be used in some special cases if the reverse running is disabled.		
F00.15	Motor parameter autotuning	0: No operation 1: Rotation autotuning Comprehensive motor parameter autotune.	0	◎

Function code	Name	Detailed illustration of parameters	Default	Modify
		It is recommended to use rotation autotuning when high control accuracy is needed. 2: Static autotuning It is suitable in the cases when the motor cannot de-couple form the load. The antotuning for the motor parameter will impact the control accuracy. 3: Static autotuning 2 (No autotuning for non-load current and mutual inductance)		
F00.18	Function restore parameter	0: No operation 1: Restore the default value 2: Clear fault records Note: The function code will restore to 0 after finishing the operation of the selected function code. Restoring to the default value will cancel the user password. Use this function with caution.	0	◎
F01 Group Start-up and stop control				
F01.08	Stop mode	0: Decelerate to stop. After the stop command becomes valid, the inverter decelerates to reduce the output frequency during the set time. When the frequency decreases to 0Hz, the inverter stops. 1: Coast to stop. After the stop command	0	○

Function code	Name	Detailed illustration of parameters		Default	Modify
		becomes valid, the inverter ceases the output immediately. And the load coasts to stop at the mechanical inertia.			
F01.18	Operation protection	0: The terminal running command is invalid when powering on. 1: The terminal running command is valid when powering on.		1	○
F01.21	Restart after power off	0: Disabled 1: Enabled		1	○
F02 Group	Motor 1 parameters				
F02.00	Motor type	0: Asynchronous motor 1: Reserved		0	◎
F02.01	Rated power of asynchronous motor	0.1~3000.0kW	Set the parameter of the asynchronous motor. In order to ensure the controlling performance, set the F02.01~F02.05 according to the name plate of the asynchronous motor. PV100 series inverters provide the function of parameter autotuning. Correct	Depend on model	◎
F02.02	Rated frequency of asynchronous motor	0.01Hz~P00.03		50.00 Hz	◎
F02.03	Rated rotating speed of asynchronous motor	1~36000rpm		Depend on model	◎
F02.04	Rated voltage of asynchronous motor	0~1200V		Depend on model	◎

Function code	Name	Detailed illustration of parameters		Default	Modify
F02.05	Rated current of asynchronous motor	0.8~6000.0A	parameter autotuning comes from the correct setting of the motor name plate. In order to ensure the controlling performance, please configure the motor according to the standard principles, if the gap between the motor and the standard one is huge, the features of the inverter will decrease. Note: Resetting the rated power (F02.01) of the motor can initialize the motor parameters F02.02~F02.10.	Depend on model	◎
F02.06	Stator resistor of asynchronous motor	0.001~65.535Ω	After the motor parameter autotuning finishes, the set values of F02.06~F02.10 will be updated automatically. These parameters are basic parameters controlled	Depend on model	○
F02.07	Rotor resistor of asynchronous motor	0.001~65.535Ω		Depend on model	○
F02.08	Leakage inductance of asynchronous	0.1~6553.5mH		Depend on model	○

Function code	Name	Detailed illustration of parameters		Default	Modify
	motor		by vectors which directly impact the features. Note: Users cannot modify the parameters freely.		
F02.09	Mutual inductance of asynchronous motor	0.1~6553.5mH		Depend on model	○
F02.10	Non-load current of asynchronous motor	0.1~6553.5A		Depend on model	○
F04 Group	SVPWM control				
F04.00	V/F curve setting	These function codes define the V/F curve of PV100 series motor 1 to meet the need of different loads. 0: Straight line V/F curve; applying to the constant torque load 1: Multi-dots V/F curve 2: Torque-stepdown characteristic curve (1.3 order) 3: Torque-stepdown characteristic curve (1.7 order) 4: Torque-stepdown characteristic curve (2.0 order) Curves 2~4 apply to the torque loads such as fans and water pumps. Users can adjust according to the features of the loads to get the best performance. 5: Customized V/F(V/F separation); in this mode, V can be separated from f and f can be adjusted through the frequency given channel set by **F**00.06 or the voltage given channel set by **F**04.27 to		4	◎

Function code	Name	Detailed illustration of parameters	Default	Modify
		change the feature of the curve. Note: V_b in the below picture is the motor rated voltage and f_b is the motor rated frequency. 		
F04.01	Torque boost	Torque boost to the output voltage for the features of low frequency torque. F04.01 is for the Max. output voltage Vb. F04.02 defines the percentage of closing frequency of manual torque to fb. Torque boost should be selected according to the load. The bigger the load is, the bigger the torque is. Too big torque boost is inappropriate because the motor will run with over magnetic, and the current of the inverter will increase to add the temperature of the inverter and decrease the efficiency. When the torque boost is set to 0.0%, the inverter is automatic torque boost. Torque boost threshold: below this frequency point, the torque boost is valid, but over this frequency point, the torque boost is invalid.	0.0%	○
F04.02	Torque boost close		20.0%	○

Function code	Name	Detailed illustration of parameters	Default	Modify
		 Setting range of F04.01: 0.0%: (automatic) 0.1%~10.0% Setting range of F04.02: 0.0%~50.0%		
F04.03	V/F frequency point 1 of motor 1	If F04.00 =1, the user can set V//F curve by F04.03~F04.08. V/F is set to the motor load. Note: V1＜V2＜V3; f1＜f2＜f3. If the low-frequency voltage is high, overtemperature and burning may occur and the overcurrent stall and protection may occur to the inverter.  Setting range of F04.03: 0.00Hz~F04.05 Setting range of F04.04: 0.0%~110.0% (rated voltage of motor1) Setting range of F04.05: F04.03~F04.07 Setting range of F04.06: 0.0%~110.0%(rated voltage of motor1) Setting range of F04.07:	0.00Hz	○

Function code	Name	Detailed illustration of parameters	Default	Modify
		frequency The bigger the value is, the stronger the effect and faster the adjustment is.		
F15.10	PI switching point	0.0~6553.5Vdc If the absolute value of bus voltage minus the reference value is bigger than F15.10, it will switch to F15.08 and F15.09; otherwise it is F15.06 and F15.07.	20.0V	◎
F15.11	Water level control	0: Digital input of the water-level control 1: AI1(the water-level signal is input through AI1, not supported currently) 2: AI2 (the water-level signal is input through AI2) 3: AI3 (the water-level signal is input through AI3) If the function code is 0, the water-level signal is controlled by the digital input. See 43 and 44 functions of S terminals in group F05 for detailed information. If the full-water signal is valid, the system will report the alarm (A-tF) and sleep after the time of F15.14. During the alarm, the full-water signal is invalid and the system will clear the alarm after the time of F15.15. If the empty-water signal is valid, the system will report the alarm (A-tL) and sleep after the time of F15.16.	0	◎

Function code	Name	Detailed illustration of parameters	Default	Modify
		During the alarm, the empty -water signal is invalid and the system will clear the alarm after the time of F15.17. If the function code is 1~3, it is the reference of water-level control analog signal. For details, see F15.12 and F12.13.		
F15.12	Full-water level threshold	0.0~100.0% This code is valid when F15.11 water level control is based on analog input. If the detected water level control analog signal is less than the water level threshold F15.12 and keeps in the state after the delay time F15.14, the system reports A-tF and sleeps. If the delay time is not reached, the signal is bigger than the water level threshold, the time will be cleared automatically. When the measured water level control analog signal is less than the water level threshold, the delay time will be counted again. 0 is full water and 1 is no water. During the full-water alarm, if the detected water level signal is higher than the threshold of F15.12 and the delay counts, the alarm is cleared after the time set by F15.15 is reached in this	25.0%	○

Function code	Name	Detailed illustration of parameters	Default	Modify
		continuous state continues. During the non-continuous application, the delay timing will clear automatically.		
F15.13	Empty-water level threshold	0.0~100.0% This code is valid when F15.11 water level control is based on analog input. If the detected water level control analog signal is greater than the water level threshold P15.13 and keeps in the state after the delay time F15.16, the system reports A- tL and sleeps. If the delay time is not reached (that means non-continuous), the delay time is automatically cleared. When the detected water level control analog signal is less than the water level threshold, the delay counts. During the empty-water alarm, if the detected water level control analog signal is less than the water level threshold F15.13 and delay counts, the empty-water alarm is cleared after the delay time set by F15.17 in this continous state. In the non-continuous state, the delay time is automatically cleared.	75.0%	○
F15.14	Full water delay	0~10000s Time setting of full water delay (This	5s	○

Function code	Name	Detailed illustration of parameters	Default	Modify
		function code is still valid when the digital indicates the full-water signal.)

Function code	Name	Detailed illustration of parameters	Default	Modify
		converter module.		

Note:

- The time when the pump inverter operated to the lower limit of PI output frequency after inverter start-up is determined by the ACC time.
- Delay time counting follows the rules if multiple fault conditions are met simutaneously: For example, if all fault conditions of weak light, full water, and underload are met at the same time, the inverter will count the delay time for each fault independently. If the delay time of a fault is reached, the fault is reported. The delay time counting of the other two faults keeps. If the reported fault is resolved but the conditions of the other two faults persist, the delay time counting of the other two faults continues. If a fault condition is not met during counting, the delay time of this fault is cleared.

7 Fault diagnosis and solution

Do as follows after the inverter encounters a fault:

1. Check to ensure there is nothing wrong with the keypad. If not, please contact with the local Souer office.
2. If there is nothing wrong, please check F07 and ensure the corresponding recorded fault parameters to confirm the real state when the current fault occurs by all parameters.
3. See the following table for detailed solution and check the corresponding abnormal state.
4. Eliminate the fault and ask for relative help.
5. Check to eliminate the fault and carry out fault reset to run the inverter.

Fault code	Fault type	Possible cause	Solutions
OUt1	IGBT U	1. The acceleration is too fast. 2. This phase IGBT is damaged internally. 3. Interference causes misoperation. 4. The drive wire is connected improperly. 5. The load transients or is abnormal. 6. The grounding is short circuited.	1. Increase the acceleration time. 2. Change the power unit. 3. Check the drive wire. 4. Check whether the peripheral equipment has strong interference sources.
OUt2	IGBT V		
OUt3	IGBT W		
OV1	Overvoltage when acceleration	1. The input voltage is abnormal. 2. There is large energy feedback. 3. No braking components. 4. Braking energy is not open.	1. Check the input power. 2. Check if the DEC time of the load is too short or the inverter starts during the rotation of the motor or it needs to increase the energy consumption components. 3. Install the braking components. 4. Check the setting of relative function codes.
OV2	Overvoltage when deceleration		
OV3	Overvoltage when constant speed running		
OC1	Overcurrent when acceleration	1. The acceleration or deceleration is too fast. 2. The voltage of the grid is too low. 3. The power of the inverter is	1. Increase the ACC time. 2. Check the input power. 3. Select the inverter with a larger power. 4. Check if the load is short
OC2	Overcurrent when deceleration		

Fault code	Fault type	Possible cause	Solutions
OC3	Overcurrent when constant speed running	too low. 4. The load transients or is abnormal. 5. The grounding is short circuited or the output is phase loss. 6. There is strong external interference. 7. The overvoltage stall protection is not open.	circuited (the grounding short circuited or the wire short circuited) or the rotation is not smooth. 5. Check the output configuration. 6. Check if there is strong interference. 7. Check the setting of relative function codes.
UV	Bus undervoltage	1. The voltage of the power supply is too low. 2. The overvoltage stall protection is not open.	1. Check the input power of the supply line. 2. Check the setting of relative function codes.
OL1	Motor overload	1. The voltage of the power supply is too low. 2. The motor setting rated current is incorrect. 3. The motor stall or load transients is too strong.	1. Check the power of the supply line. 2. Reset the rated current of the motor. 3. Check the load and adjust the torque lift.
OL2	Inverter overload	1. The acceleration is too fast. 2. The rotating motor is reset. 3. The voltage of the power supply is too low. 4. The load is too heavy. 5. The motor power is too small.	1. Increase the ACC time. 2. Avoid the restarting after stopping. 3. Check the power of the supply line. 4. Select an inverter with bigger power. 5. Select a proper motor.
SPI	Input phase loss	Phase loss or fluctuation of input R,S,T	1. Check input power. 2. Check installation distribution.
SPO	Output phase loss	U,V,W phase loss output (or serious asymmetrical three phase of the load)	1. Check the output distribution. 2. Check the motor and cable.
OH1	Rectifier overheat	1. Air duct jam or fan damage	1. Dredge the wind channel or

Fault code	Fault type	Possible cause	Solutions
OH2	IGBT overheat	2. Ambient temperature is too high. 3. The time of overload running is too long.	change the fan. 2. Decrease the environment temperature.
EF	External fault	SI external fault input terminals action	Check the external device input.
CE	Communication error	1. The baud rate setting is incorrect. 2. Fault occurs to the communication wiring. 3. The communication address is wrong. 4. There is strong interference to the communication.	1. Set proper baud rate. 2. Check the communication connection distribution 3. Set proper communication address. 4. Change or replace the connection distribution or improve the anti-interference capability.
ItE	Current detection fault	1. The connection of the control board is not good. 2. Assistant power is bad 3. Hall components is broken 4. The magnifying circuit is abnormal.	1. Check the connector and repatch. 2. Change the Hall. 3. Change the main control panel.
tE	Autotuning fault	1. The motor capacity does not comply with the inverter capability. 2. The rated parameter of the motor is not set correctly. 3. The offset between the parameters from autotune and the standard parameter is huge 4. Autotune overtime	1. Change the inverter mode. 2. Set the rated parameter according to the motor name plate. 3. Empty the motor load. 4. Check the motor connection and set the parameter. 5. Check if the upper limit frequency is above 2/3 of the rated frequency.
EEP	EEPROM fault	1. Error of controlling the write and read of the parameters 2. Damage to EEPROM	1. Press STOP/RST to reset. 2. Change the main control panel.
PIDE	PID feedback fault	1. PID feedback is offline.	1. Check the PID feedback signal

Fault code	Fault type	Possible cause	Solutions
		2. The PID feedback source disappears.	2. Check the PID feedback source.
END	Time arrival of factory setting	The actual running time of the inverter is above the internal setting running time.	Ask for the supplier and adjust the setting running time.
OL3	Electrical overload	The inverter will report overload pre-alarm according to the set value.	Check the load and the overload pre-alarm point.
ETH1	Grounding short circuit fault 1	The grounding of the inverter output terminal is short circuited. The current detection circuit is faulty. The actual motor power sharply differs from the inverter power.	Check whether the motor wiring is proper. Change the Hall. Change the main control panel. Set motor parameters correctly.
ETH2	Grounding short circuit fault 2		
DEU	Velocity deviation fault	The load is too heavy or stalled.	1. Check the load and ensure it is normal. Increase the detection time. 2. Check whether the control parameters are normal.
STO	Maladjustment fault	1. The control parameters of the synchronous motors not set properly. 2. The autotuning parameter is not correct. 3. The inverter is not connected to the motor.	1. Check the load and ensure it is normal. 2. Check whether the control parameter is set properly or not. 3. Increase the maladjustment detection time.
LL	Electronic underload fault	The inverter will report the underload pre-alarm according to the set value.	Check the load and the underload pre-alarm point.
TSF	Hydraulic probe damage	Hydraulic probe damage	Change the damaged hydraulic probe.

Fault code	Fault type	Possible cause	Solutions
PINV	PV reverse connection fault	Incorrect PV wiring	Change the wiring direction of the positive and negative terminals and connect the cables again.
PVOC	PV overcurrent	1. The acceleration or deceleration is too fast. 2. The inverter power is too low. 3. The load transients or is abnormal. 4. The grounding is short circuited.	1. Increase the ACC or DCC time. 2. Select the inverter with a larger power. 3. Check if the load is short circuited (the grounding short circuited or the wire short circuited) or the rotation is not smooth.
PVOV	PV overvoltage	1. The solar cell panel input voltage is too high. 2. Model -4 is set as another model.	1. Reduce the number of solar cell panels that are wired in series. 2. Check and reset the model.
PVLV	PV undervoltage	1. The power of the solar cell panel series is too low or it is cloudy and rainy weather. 2. The motor start-up current is too high.	1. Increase the number of solar cell panels or perform the test in the normal sun light. 2. Change the motor.
E-422	Fault on communication with boost module 422	Improper contact with the communication cables	Check the four communication cables of 422 and ensure that they are connected properly.
OV	Bus overvoltage detected at the boost module side	The sun light changes suddenly.	Adjust the boost PI parameters. Enlarge the values of F19.07 and F19.08.
A-LS	Weak light alarm	The sun light is weak or the solar cell panel configuration is insufficient.	The equipment automatically runs when the light becomes strong. Check whether the solar cell

Fault code	Fault type	Possible cause	Solutions
			panel configuration is proper.
A-LL	Underload alarm	The reservoir is empty.	Check the reservoir.
A-TF	Full-water alarm	The reservoir is full.	If the user has set the full-water alarm function, the equipment automatically stops when the full-water alarm time reaches the specified time. In this situation, the user does not need to perform any operation. Otherwise, check whether terminals are wired incorrectly.
A-TL	Empty-water alarm	The reservoir is empty.	If the user has set the empty-water alarm function, the equipment automatically stops when the empty-water alarm time reaches the specified time. In this situation, the user does not need to perform any operation. Otherwise, check whether terminals are wired incorrectly.

Appendix A Options and use

A.1 Cables

A.1.1 Power cables

Dimension the input power and motor cables according to local regulations.

Note: A separate PE conductor is required if the conductivity of the cable shield is not sufficient for the purpose.

A.1.2 Control cables

The relay cable needs the cable type with braided metallic screen.

Keypads need to be connected with network cables. The network cables must be shielded in complicated electromagnetic environments.

Communication cables must be shielded twisted pairs.

Note:

- Run analog and digital signals in separate cables.
- Check the insulation of the input power cable according to local regulations before connecting to the drive.

Recommended power cables for standard inverter models

Model	Recommended cable size (mm^2)		Terminal screw	Tightening torque (Nm)
	(+)/(-), R/S/T, U/V/W	PE

PV100-055G-4T	70	35	M10	18~23
PV100-075G-4T	95	50	M10	18~23
PV100-090G-4T	120	70	M10	18~23
PV100-110G-4T	150	70	M12	31~40

Note:

It is appropriate to use the recommended cable size under 40℃ and rated current. The wiring distance should be no more than 100m.

If the control cable and power cable must cross, the angle between them must be 90℃.

If the inside of the inverter is moist, the insulation resistance will decrease. If there is moisture in the inverter, dry up the inverter and measure the humidity again.

A.2 Reactors

If the distance between the inverter and the motor is longer than 50m, frequent overcurrent protection may occur to the inverter because of high leakage current caused by parasitic capacitance effects from the long cables to the ground. In order to avoid the damage of the motor insulation, it is necessary to add reactor compensation. If the distance between the inverter and motor is 50~100m, see the table below for model selection; if it exceeds 100m, consult with Suoer technical support

Note: The rated derate voltage of the output reactor is 1%±15%.

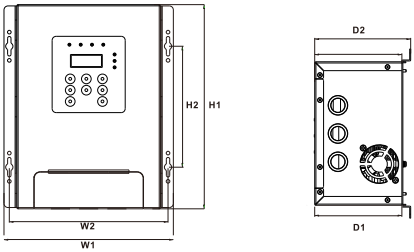
Appendix C Dimension drawings

C.1 Dimensions of 4-37kW models



(a) Wall mounting

Dimensions in wall mounting (unit: mm)

Model	W1	W2	H1	H2	D1	D2	Installation hole (d)
PV100-0R4G-SS	210	196.8	253.2	150	108.1	119	5
PV100-0R7G-SS	210	196.8	253.2	150	108.1	119	5
PV100-1R5G-SS	210	196.8	253.2	150	108.1	119	5
PV100-2R2G-SS	210	196.8	253.2	150	108.1	119	5
PV100-0R4G-S	210	196.8	253.2	150	108.1	119	5
PV100-0R7G-S	210	196.8	253.2	150	108.1	119	5
PV100-1R5G-S	210	196.8	253.2	150	108.1	119	5
PV100-2R2G-S	210	196.8	253.2	150	108.1	119	5
PV100-0R7G-4T	210	196.8	253.2	150	108.1	119	5
PV100-1R5G-4T	210	196.8	253.2	150	108.1	119	5
PV100-2R2G-4T	210	196.8	253.2	150	108.1	119	5

Dimensions in wall mounting (unit: mm)

Model	W1	W2	H1	H2	D1	D2	Installation hole (d)
PV100-004G-4T	272	160	319.8	350.8	142.8	142.8	5
PV100-5R5G-4T	272	160	319.8	350.8	142.8	142.8	5
PV100-7R5G-4T	320	160	400	412.8	177.5	177.5	6
PV100-011G-4T	320	160	400	412.8	177.5	177.5	6
PV100-015G-4T	320	160	400	412.8	177.5	177.5	6
PV100-004G-2T	320	160	400	412.8	177.5	177.5	6
PV100-5R5G-2T	320	160	400	412.8	177.5	177.5	6
PV100-7R5G-2T	320	160	400	412.8	177.5	177.5	6
PV100-018G-4T	320	160	400	412.8	177.5	177.5	6
PV100-022G-4T	302	235	443	456	219.7	219.7	6
PV100-030G-4T	302	235	443	456	219.7	219.7	6
PV100-037G-4T	302	235	443	456	219.7	219.7	6

Appendix D Further information

D.1 Product and service inquiries

Address any inquiries about the product to your local Souer offices, quotingthe type designation and serial number of the unit in question. A listing of Souer sales, support and service contacts can be found by navigating to Web:www.chinasuoer.com

B.2 Feedback o f Souer Inverters manuals

Your comments on our manuals are welcome. Go to Web:www.chinasuoer.com and select Online Feedback of Contact Us.

B.3 Document library on the Internet

You can find manuals and other product documents in PDF format on the Internet. Go to Web:www.chinasuoer.com and select Service and Support of Document Download.
